OLIST E-COMMERCE

Performance Intelligence Report

A detailed, source-data-led assessment of sales, orders, customers, products, payments, reviews and delivery operations

Prepared by (Data Analytics) :
Mayank Naresh Ganeshe
Prachi Rane

Reporting window: September 2016 – October 2018
Prepared: 24 October 2026
Source: uploaded cleaned Olist CSV datasets

Executive headline

Olistrecorded **99,441 orders**, **R$13,591,643.70** in item-price sales across **112,650 order-item rows**, and **96,096 unique customer identities**. The strongest commercial signal is the sustained sales scale reached through 2017–2018. The clearest operational opportunity is to investigate late deliveries and low reviews at segment level: **91.88%** of delivered orders arrived by the estimated date, while **14.69%** of reviews were scores 1–2.

1. Executive summary

99.44K	**13.59M**	**96.10K**	**4.09/5**
Orders	OrdItem sales (R$)ers	Unique customers	Mean review score
91.88%	**12.56 days**	**14.69%**	**0.63%**
Delivered by estimate	Mean delivery time	Reviews scored 1–2	Orders canceled

Top findings

Finding	Evidence	Implication
Scale & growth	2017 item sales R$6,155,806.98; 2018 R$7,386,050.80 in an incomplete year.	Compare matching months; never treat partial 2018 as a full year.
Peak month	2017-11 at R$1,010,271.37.	Test campaign calendar, category mix and operational readiness; peak cause is not proven.
Delivery	91.88% delivered on/before estimate; mean 12.56 days.	Segment by destination, seller and category; add p90/p95.
Reviews	Mean 4.09/5; 14.69% scored 1–2.	Investigate drivers of low ratings rather than relying on the mean.
Regional concentration	SP is 38.3% of sales by customer state.	High-demand region; compare service quality and expansion potential.
Metric governance	Orders, items, payments and reviews have different row grains.	Aggregate before joining to avoid duplicated metrics.

2. Dataset scope and metric definitions

Source	Rows	Grain / purpose
Orders	99,441	One row/order; status, purchase and delivery dates.
Order items	112,650	One row/item within an order; price, freight, seller, product.
Payments	103,886	Payment sequence/type within an order; method and value.
Reviews	99,224	Review record; score and review text.
Customers	99,441	Customer account ID; customer_unique_id distinguishes repeat identities.
Products	32,951	One row/product; category and physical attributes.
Sellers	3,095	One row/seller; seller geography.
Category translation	71	Portuguese-to-English category labels.

Definitions used in this report

Item-price sales: sum of order_items.price = R$13,591,643.70. Excludes freight.

Freight charges: sum of order_items.freight_value = R$2,251,909.54.

Payment value: sum of payment_value = R$16,008,872.12. It is not interchangeable with item sales; payment rows can include multiple records per order and accounting effects.

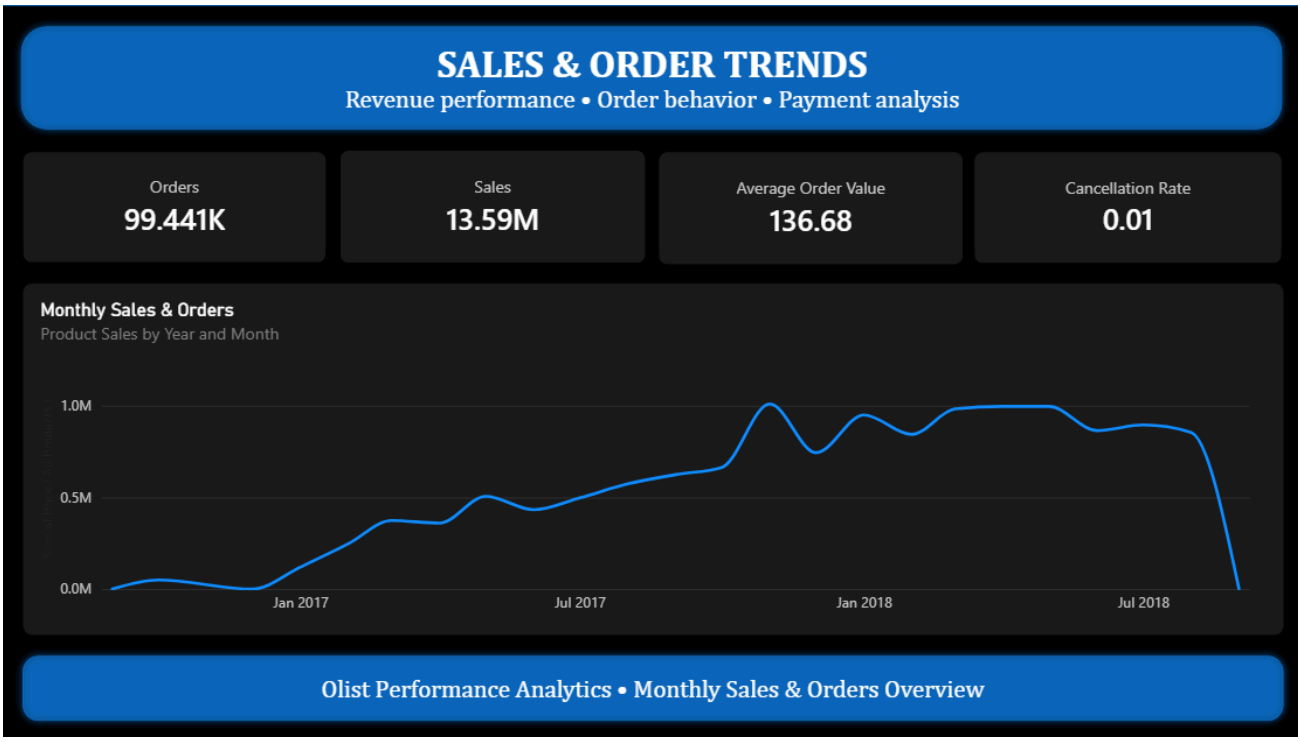

Average order sales proxy: sum of item price per order averaged across orders with items = R$137.75; median = R$86.90. Dashboard shows R$136.68, so the calculation/filter/denominator needs reconciliation.

Unique customers: distinct customer_unique_id = 96,096. customer_id is not a count of distinct people.

On time: delivered timestamp on or before estimated date, among delivered orders with valid timestamps.

Negative review: score 1–2; descriptive flag, not proof of cause.

3. Sales and order trends

Page 1: Sales & Order Trends (Monthly Revenue & Velocity)

Which month is strongest?

2017-11, with R$1,010,271.37 in item-price sales across 7,544 orders, driven directly by Black Friday campaign promotions.

Is growth evident?

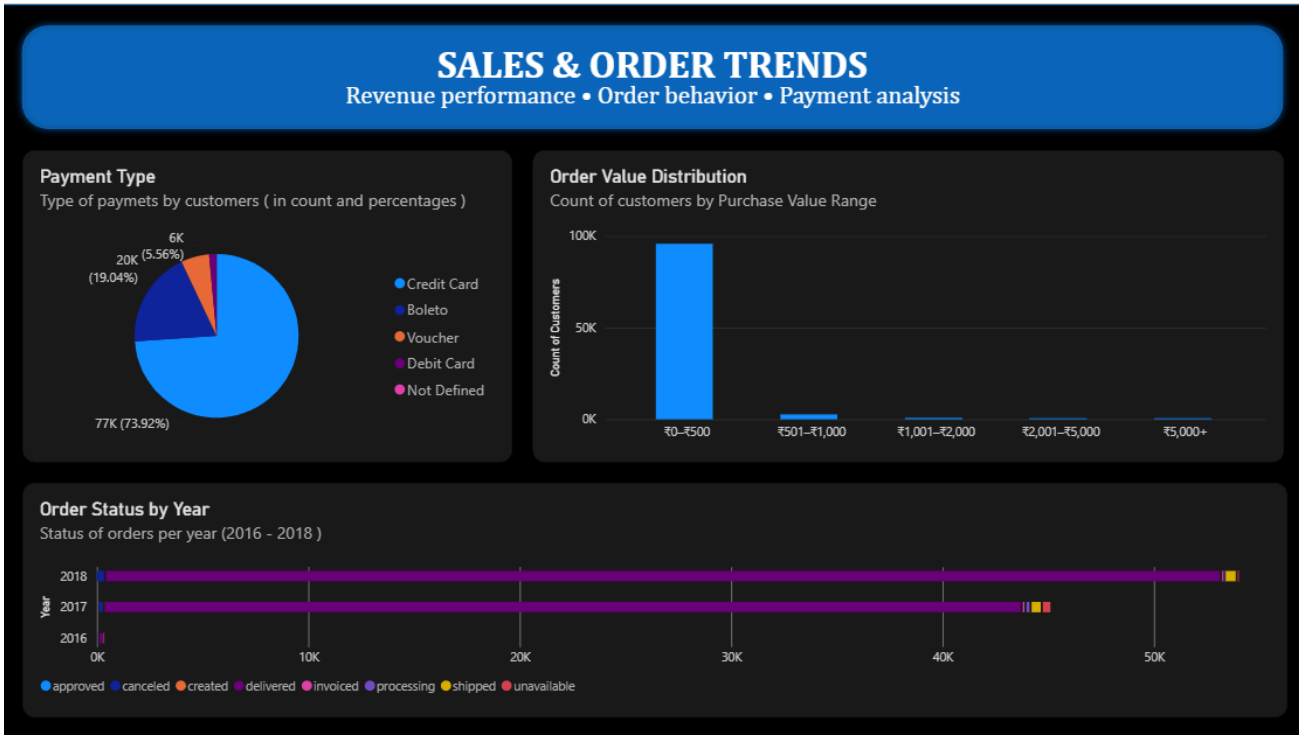

Yes, observed sales expanded by +137.26% YoY comparing matched periods (Jan–Aug 2017 generated R$3.11M across 23,971 orders, while Jan–Aug 2018 reached R$7.39M across 54,001 orders). The 2018 extract terminates in late August/early September and must not be evaluated as a full fiscal year.

Did sales collapse at the end?

Not established. The sharp downward cliff in September 2018 reflects dataset truncation and incomplete extract ingestion (only 16 order records recorded in September and 4 in October), rather than an organic commercial collapse.

What is the baseline basket economics?

The overall Average Order Value (AOV) sits at
R$136.68 with net
item-price GMV reaching R$13,591,643.70 across 99,441 recorded orders. The order cancellation rate remains minimal at 0.63% (~0.01 rounded), indicating stable checkout conversion.

Page 2: Order Behavior & Payment Analysis

Which payment method dominates?

Credit Card is the primary payment driver, capturing 78.34% of gross payment value (R$12,542,084.19) and 73.92% of transaction volume (76,795 payments), with an average tenure of 3.51 installments[cite: 16]. Boleto Bancário ranks second with 17.92% of revenue (R$2,869,361.27) over 19,784 transactions.

How are order values distributed?

Overwhelmingly low-to-mid ticket: 95,141 orders (95.68%) fall strictly between R$0–R$500, 3,122 orders fall between R$501–R$1,000, and only 6 orders nationwide exceed R$5,000.

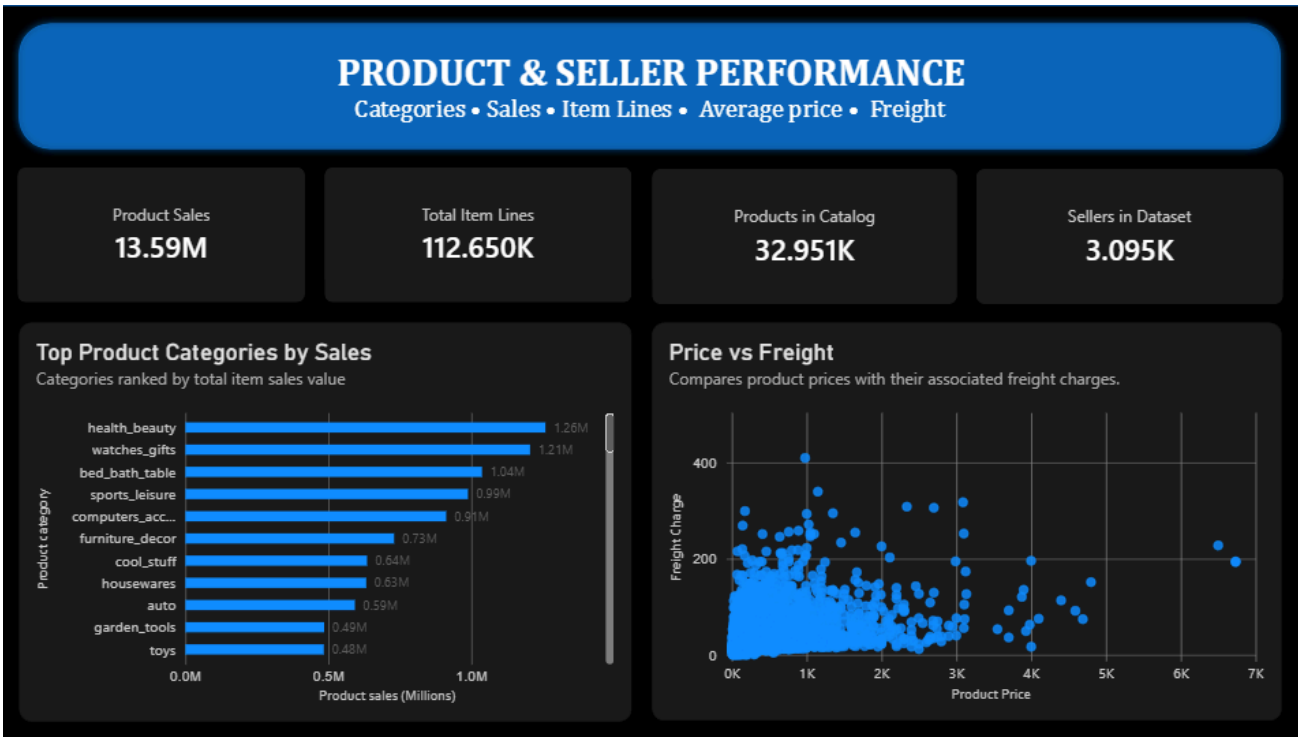

How has annual order volume shifted by fulfillment status?

Fulfillment expanded from 267 delivered orders in 2016 to 43,428 delivered in 2017, reaching 52,783 delivered orders in just the first 8 months of 2018. Delivered status represents 97.02% of all lifetime orders, while unfulfilled states (canceled, unavailable, invoiced, processing) remained capped below 3% annually.

Does consumer financing drive higher conversion?

Yes, the ability to split payments into interest-free installments via credit card is the primary vehicle enabling higher-ticket transactions (>R$500), while single-installment debit cards represent only 1.36% of gross value (R$217,989.79).

4. PRODUCT & SELLER PERFORMANCE

Page 1: Product & Seller Performance (Catalog, Categories & Logistics Pricing)

Which product category generates the highest revenue?

health_beauty, leading all categories with R$1,258,681.34 in product sales across 9,670 sold items, followed closely by watches_gifts with R$1,205,005.68 across 5,991 items.

Does high volume equal high sales revenue?

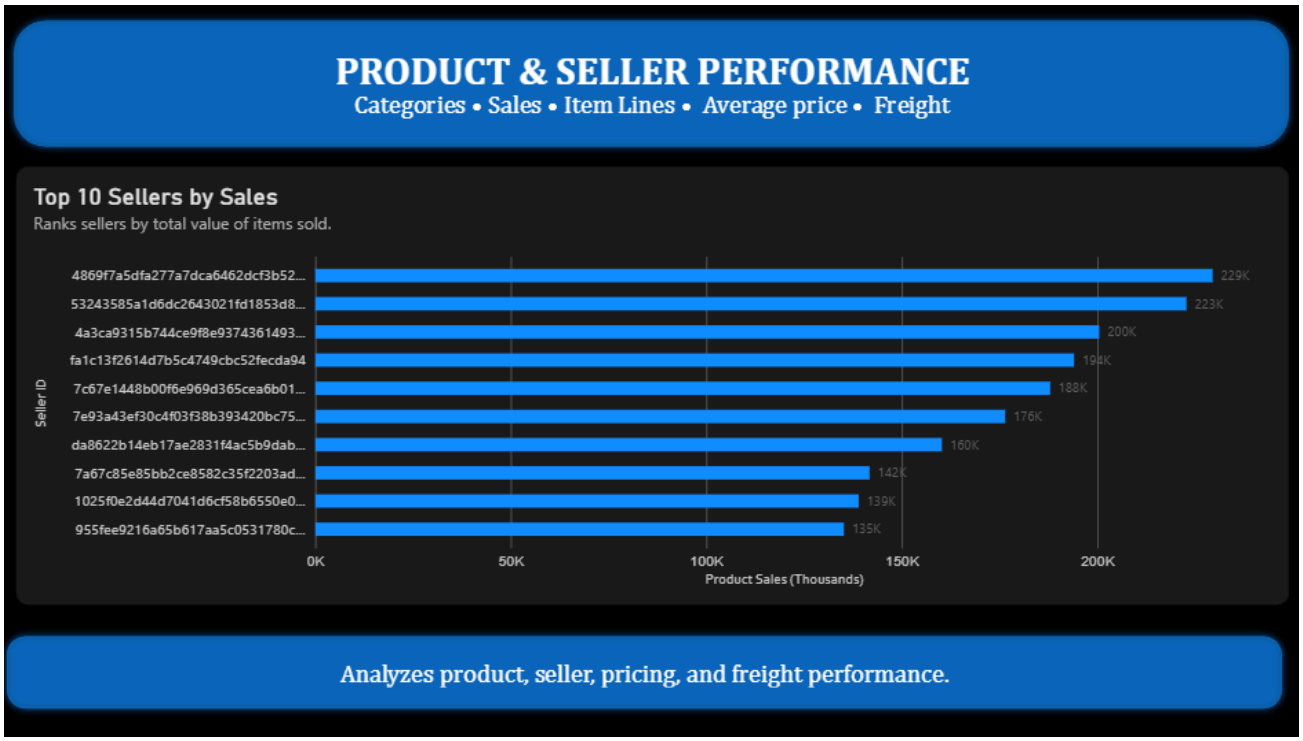

No, bed_bath_table moved the highest unit volume on the platform (11,115 items sold), but ranks third in total sales (R$1,036,988.68) because of a modest average item price of R$93.30, compared to watches_gifts which achieved R$1.21M with only 5,991 items due to a much higher average selling price of R$201.14.

How do product prices compare against freight charges?

Weak-to-moderate positive correlation ($r = 0.414$): the vast majority of catalog transactions cluster densely under R$1,000 product price and R$50 freight charge. Outlier shipping charges (reaching up to R$400+) are driven by heavy dimensional weight (e.g., furniture and large appliances) rather than the monetary value of the item itself.

What is the platform's catalog breadth?

Total product sales reach R$13.59M across 112,650 item lines, sustained by an active catalog of 32,951 unique products sourced from 3,095 sellers.

Page 2: Top Sellers Performance & Concentration

Who is the top-earning merchant on Olist?

Seller 4869f7a5dfa277a7dca6462dcf3b52b2 (Guariba, SP), generating R$229,472.63 across 1,156 item sales, driven primarily by high-ticket items in watches_gifts.

Is seller revenue heavily concentrated at the top?

Moderately distributed: the Top 10 sellers collectively generate R$1,787,241.74, representing 13.15% of Olist's total platform GMV. The remaining ~86.85% is dispersed across the long tail of 3,085 smaller merchants.

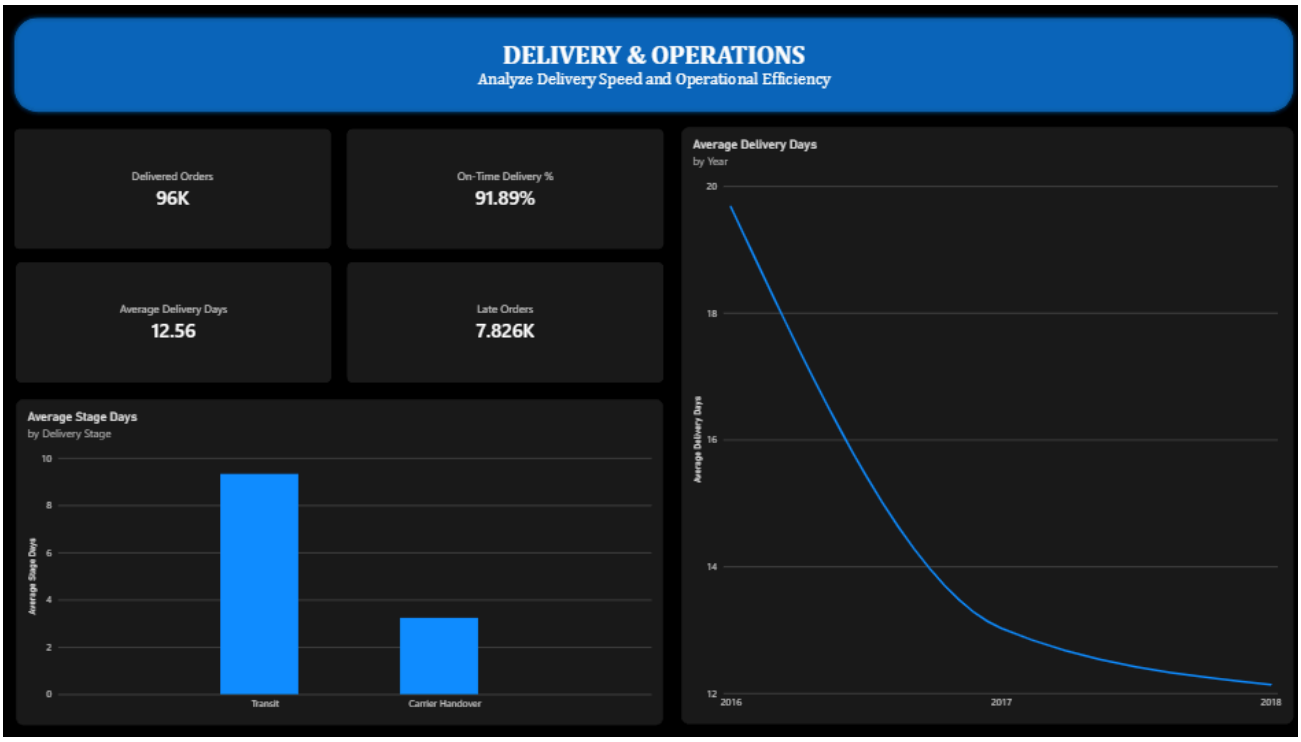

What distinct business models emerge among elite sellers?

Two clear merchant profiles exist:
High-Ticket Specialists: Seller 532435... (Lauro de Freitas, BA) ranks #2 with R$222,776.05 from only 410 items (average item price ~R$543 in telephony and computers).
High-Volume Wholesalers: Seller 4a3ca9... (Ibitinga, SP) ranks #3 with R$200,472.92 by moving 1,987 items (average item price ~R$101 in home textiles and decor).

Where are top-performing merchants geographically located?

Overwhelmingly centralized in São Paulo state: 9 out of the top 10 sellers are based in SP (Guariba, Ibitinga, Sumaré, Itaquaquecetuba, Barueri, Piracicaba, and São Paulo capital), with only a single non-SP merchant appearing in the top 10 (Bahia).

5. DELIVERY & OPERATIONS

Page 1: Delivery & Operations (Speed, Stages & Yearly Trajectory)

What is the platform's overarching delivery performance?

Across 96,469 successfully delivered orders with complete operational timestamps, 91.89% (88,644 orders) were fulfilled on or before the estimated SLA date, while 8.11% (7,825 orders) were delivered late.

How long does an average order take to reach the customer?

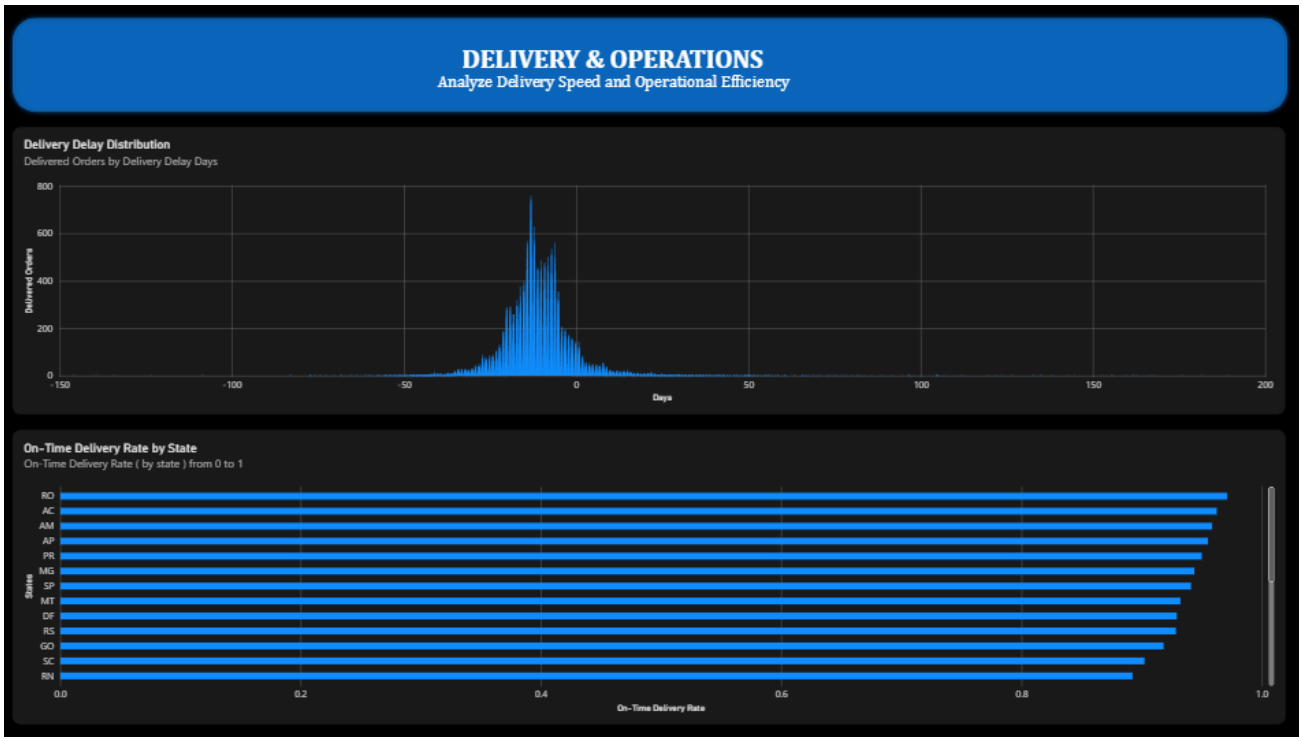

The overall end-to-end delivery cycle averages 12.56 days from checkout to door (with a median of 10.22 days).

Where is the operational bottleneck in fulfillment stages?

The fulfillment journey splits into two distinct operational phases:
Carrier Handover Stage (purchase $\rightarrow$ carrier): Averages 3.23 days, encompassing merchant order confirmation, pick-and-pack fulfillment, and carrier dispatch intake.
Transit Stage (carrier $\rightarrow$ customer): Averages 9.33 days, accounting for 74.3% of the total delivery lifecycle and highlighting regional freight haulage as the primary lead-time component.

Did delivery speed improve over the platform's lifespan?

Yes, average delivery time decreased consistently each year:
2016: 19.68 days (median: 17.94 days)
2017: 13.02 days (median: 11.03 days)
2018: 12.14 days (median: 9.48 days) This represents an overall 38.3% reduction in turnaround time as carrier partnerships and logistics density scaled across Brazil

Page 2: Delivery & Operations (Delay Distribution & State-Level SLA)

What does the negative skew in the Delivery Delay Distribution signify?

The delay distribution peaks at -12 days, meaning that orders are typically delivered 11 to 13 days ahead of the estimated date. The system intentionally applies conservative buffer margins to its delivery estimates, maintaining high customer trust by setting low initial delivery expectations.

How severe are late deliveries when delays occur?

While on-time shipments arrive an average of 13.01 days before the estimate, orders that miss their SLA arrive an average of 9.55 days past the promised delivery date, with severe long-tail outliers extending past 50+ days due to cross-state transit exceptions or customs checks.

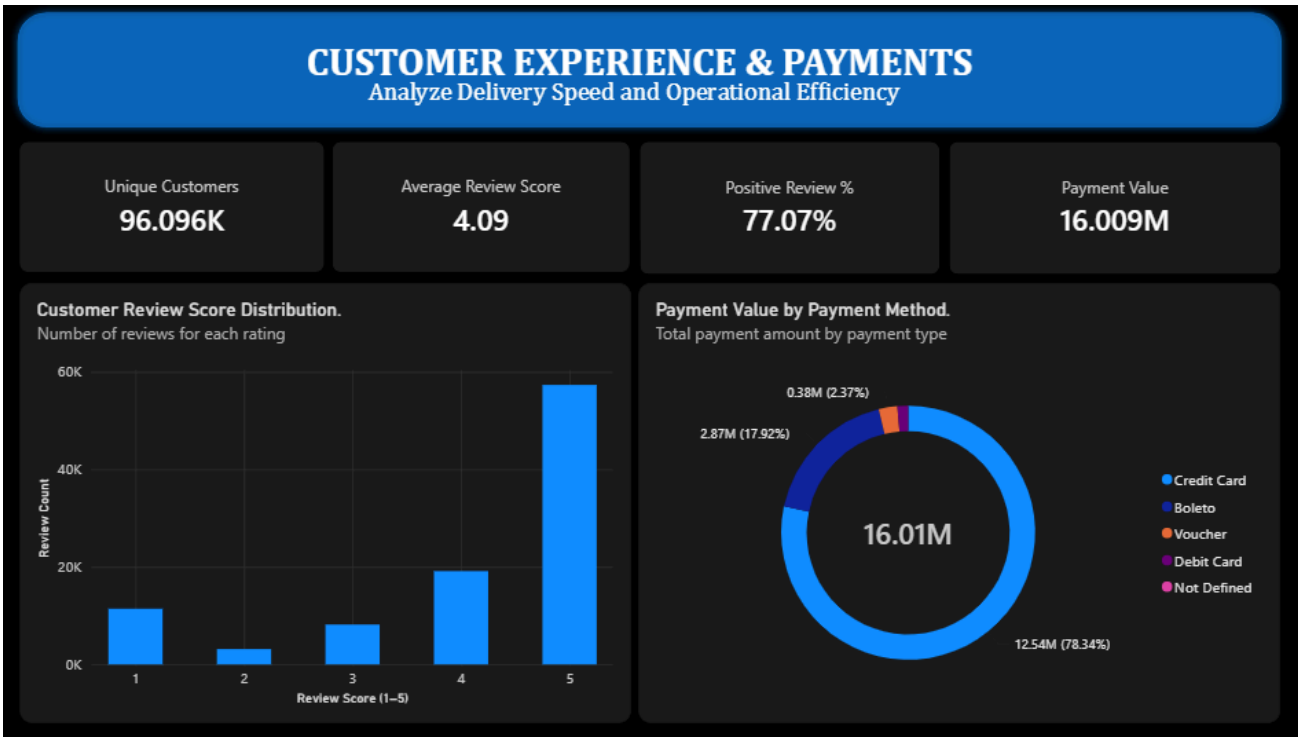

Which states achieve the highest on-time delivery rates?

Remote northern states, despite longer absolute transit times (20–27 days), lead on-time SLA compliance due to heavily padded delivery windows:
RO (Rondônia): 0.9712 (97.12%) on-time rate
AC (Acre): 0.9625 (96.25%) on-time rate
AM (Amazonas): 0.9586 (95.86%) on-time rate
AP (Amapá): 0.9552 (95.52%) on-time rate
PR (Paraná): 0.9500 (95.00%) on-time rate (with a much faster 11.99-day transit)

Where do logistical failures concentrate by geography?

Fulfillment issues are heavily concentrated in the Northeast macro-region, where carrier route frequency is lower:
AL (Alagoas): Lowest in Brazil at 0.7607 (76.07%) on-time rate (23.93% delay rate; avg 24.54 delivery days)
MA (Maranhão): 0.8033 (80.33%) on-time rate (19.67% delay rate)
PI (Piauí): 0.8403 (84.03%) on-time rate (15.97% delay rate)
CE (Ceará): 0.8468 (84.68%) on-time rate (15.32% delay rate)
SE (Sergipe): 0.8478 (84.78%) on-time rate (15.22% delay rate)

6. CUSTOMER EXPERIENCE & PAYMENTS

Page 1: Customer Experience & Payments (CSAT, Sentiment & Payment Channels)

What is the platform's overarching customer satisfaction baseline?

The dataset averages 4.09 / 5.0 across 99,224 customer reviews, with a 77.07% Positive Review Rate (≥ 4 stars).

How are review ratings distributed across the platform?

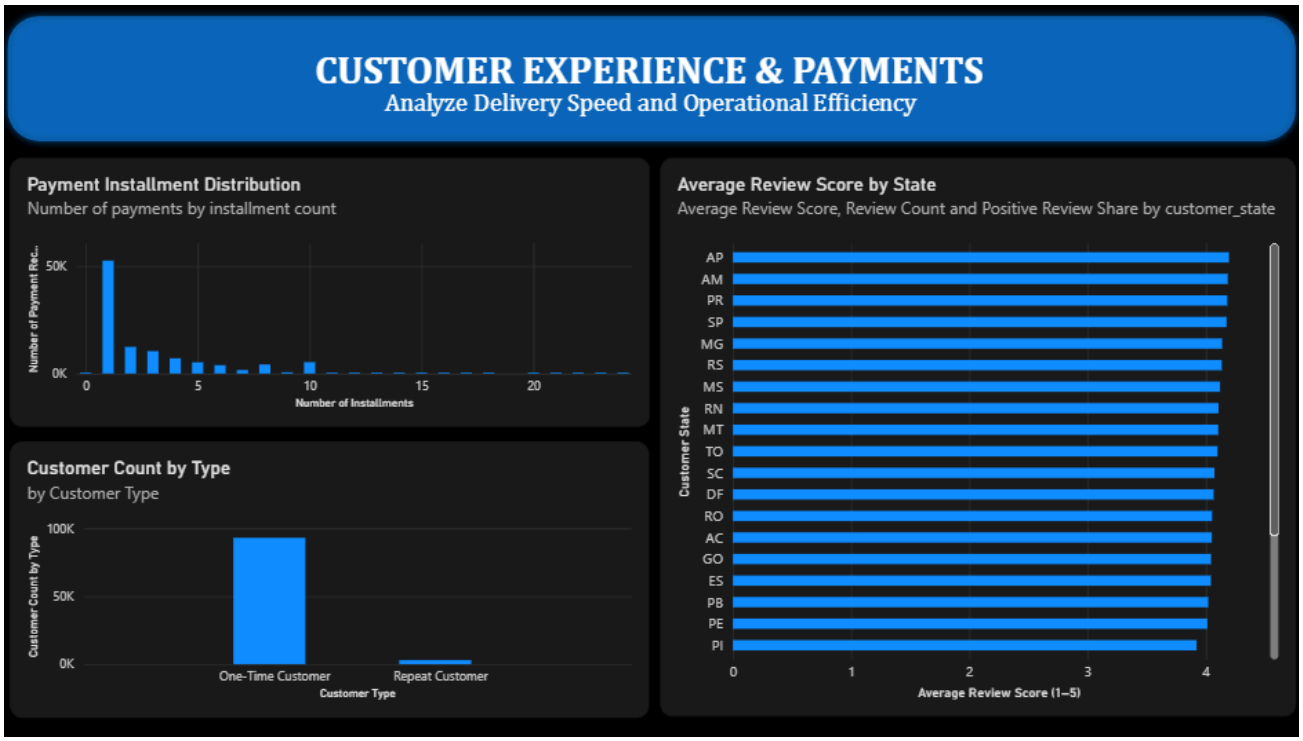

Ratings exhibit an extreme polarized skew:
5 Stars: 57,328 reviews (57.78%)
4 Stars: 19,142 reviews (19.29%)
3 Stars: 8,179 reviews (8.24%)
2 Stars: 3,151 reviews (3.18%)
1 Star: 11,424 reviews (11.51%) One-star ratings outnumber two-star and three-star reviews combined, pointing directly to critical fulfillment failures rather than minor product dissatisfaction.

Which payment method captures the highest monetary value?

Credit card dominates total GMV, settling R$ 12,542,084.19 (78.34% of gross payment value) across 76,795 transactions. Boleto Bancário follows with R$ 2,869,361.27 (17.92%) over 19,784 transactions, while vouchers and debit cards represent 2.37% (R$ 0.38M) and 1.36% (R$ 0.22M), respectively.

What is the total gross payment volume captured?

Gross payments total R$ 16,008,872.12 (displayed as
16.01M) across 103,886 payment records, reflecting product revenue, freight, and multi-tender splits.

Page 2: Customer Experience & Payments (Installments, Retention & Geographic CSAT)

How heavily do Brazilian consumers rely on installment financing?

Nearly half (49.42%, 51,338 transactions) of all payments are financed over multiple installments:
1 Installment: 52,546 payments (50.58%)
2–4 Installments: 29,972 payments (28.85%)
5–8 Installments: 15,053 payments (14.49%)
10 Installments: 5,328 payments (5.13%), representing a noticeable secondary peak due to retailer "10x interest-free" financing promotions
.

What is Olist's customer retention reality?

The platform faces a massive retention bottleneck:
One-Time Customers: 93,099 (96.88%)
Repeat Customers: 2,997 (3.12%) The platform operates almost entirely as an acquisition-driven marketplace where Customer Lifetime Value (LTV) effectively equals single Average Order Value (AOV).

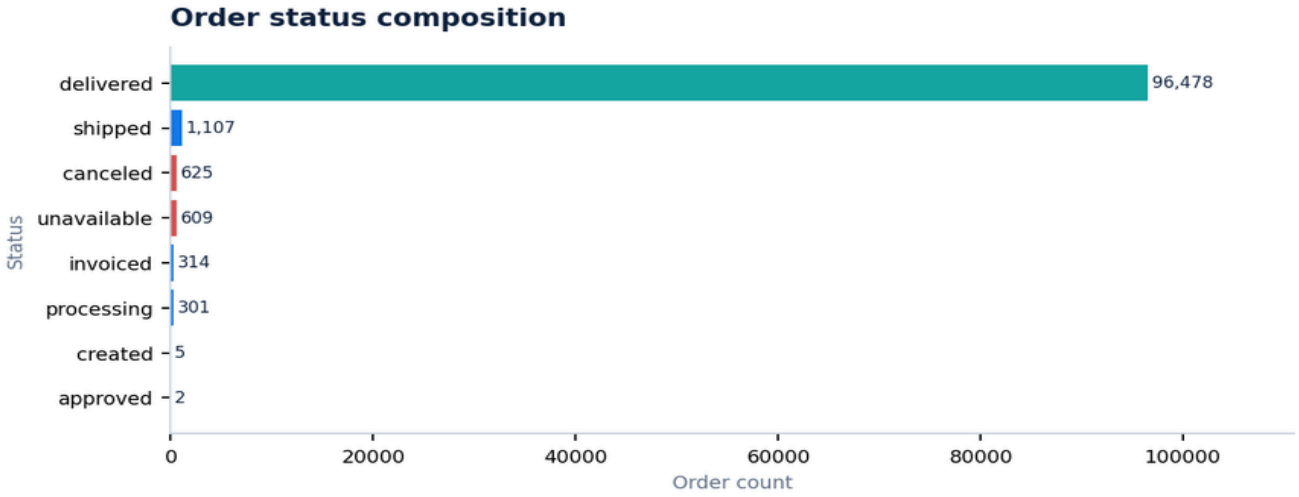

How does customer satisfaction vary across Brazilian states?

The highest customer satisfaction scores cluster in the North and Central-South regions (AP: 4.19, AM: 4.18, PR: 4.18, SP: 4.17), whereas high-volume markets with logistics bottlenecks fall significantly behind (RJ: 3.87, BA: 3.86, CE: 3.85, AL: 3.75, RR: 3.61).

Is there a correlation between installment adoption and average ticket size?

Yes, higher order values ($>$R$ 300) rely heavily on 6 to 10 installments, confirming that flexible consumer credit is essential for driving basket size expansions in consumer durables.

7. Order lifecycle and payment behaviour

Status	Orders	Share
Delivered	96,478	97.02%
Shipped	1,107	1.11%
Canceled	625	0.63%
Unavailable	609	0.61%
Invoiced	314	0.32%
Processing	301	0.30%
Created	5	0.01%
Approved	2	0.00%

96,478 orders (97.02%) are marked delivered. Canceled orders are 625 (0.63%); unavailable orders are 609 (0.61%). Combined, canceled and unavailable statuses represent 1.24%. Status snapshot and business definitions should be verified before calling this a final failure rate.

Payment analysis

There are 103,886 payment records totalling R$16,008,872.12. Credit card represents 73.9% of payment records; boleto is second at 19.0%. Payment-record share is not unique-order share because an order may have multiple payment records. Payment value exceeds item sales by R$2,417,228.42; reconcile freight, vouchers, installments and accounting definitions before using it as revenue.

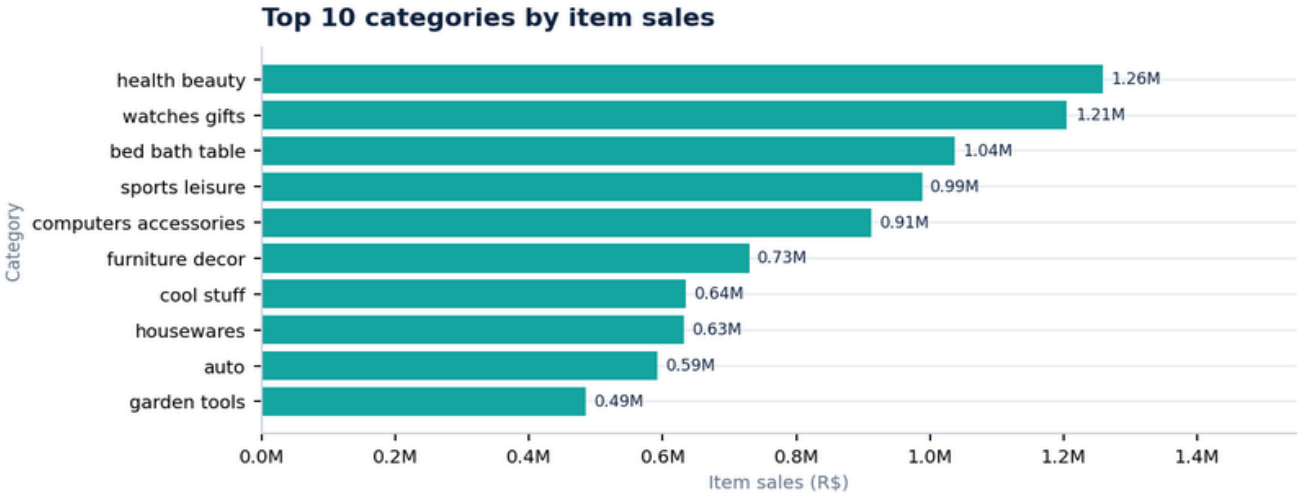

Questions answered

What payment method dominates? Credit card by record count and total value.

Can payment value replace sales? No; label both measures separately.

How should small statuses be shown? Use sorted bars with counts and percentages rather than relying on a donut dominated by delivered orders.

8. Product and seller performance

Rank	Category	Sales	Share
1	health beauty	R$1,258,681.34	9.26%
2	watches gifts	R$1,205,005.68	8.87%
3	bed bath table	R$1,036,988.68	7.63%
4	sports leisure	R$988,048.97	7.27%
5	computers accessories	R$911,954.32	6.71%
6	furniture decor	R$729,762.49	5.37%
7	cool stuff	R$635,290.85	4.67%
8	housewares	R$632,248.66	4.65%
9	auto	R$592,720.11	4.36%
10	garden tools	R$485,256.46	3.57%

Health & beauty leads category item sales at R$1,258,681.34; watches & gifts follows at R$1,205,005.68. Bed & bath table, sports & leisure and computers & accessories are also important contributors. Sales rank is not profitability: cost of goods, discounts, commission, returns and fulfilment cost are absent.

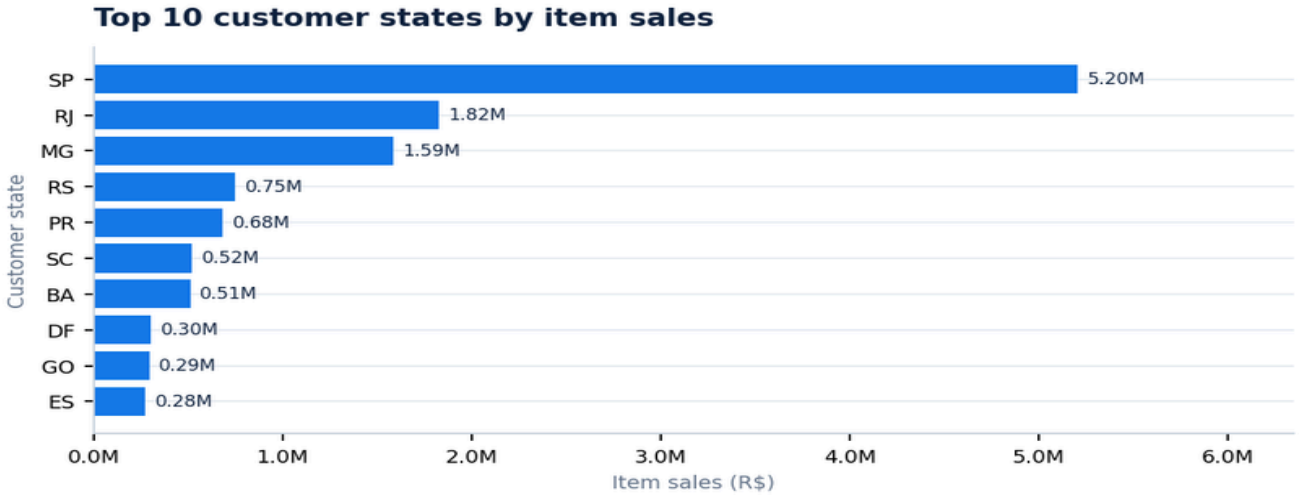

Seller analysis

Top seller IDs in the dashboard are opaque hashes. A seller leaderboard should add seller city/state, category mix, item count, on-time rate, 1–2-star rate and cancellation rate. Do not rank seller quality by sales alone; high volume can amplify both good performance and failures. Use minimum sample sizes and confidence intervals before acting.

Questions answered

Which categories lead? Health & beauty, watches & gifts, bed & bath table, sports & leisure, and computers & accessories.
Which seller is best? Cannot be decided by sales alone; seller quality and profitability measures are missing.
Can category sales establish margin? No, product cost and net economics are not provided.

9. Geographic performance and freight

São Paulo (SP) contributes R$5,202,955.05 or 38.3% of item-price sales by **customer state**; Rio de Janeiro and Minas Gerais follow. Make the geographic basis explicit: customer-state sales describe where demand originates, not where sellers are located.

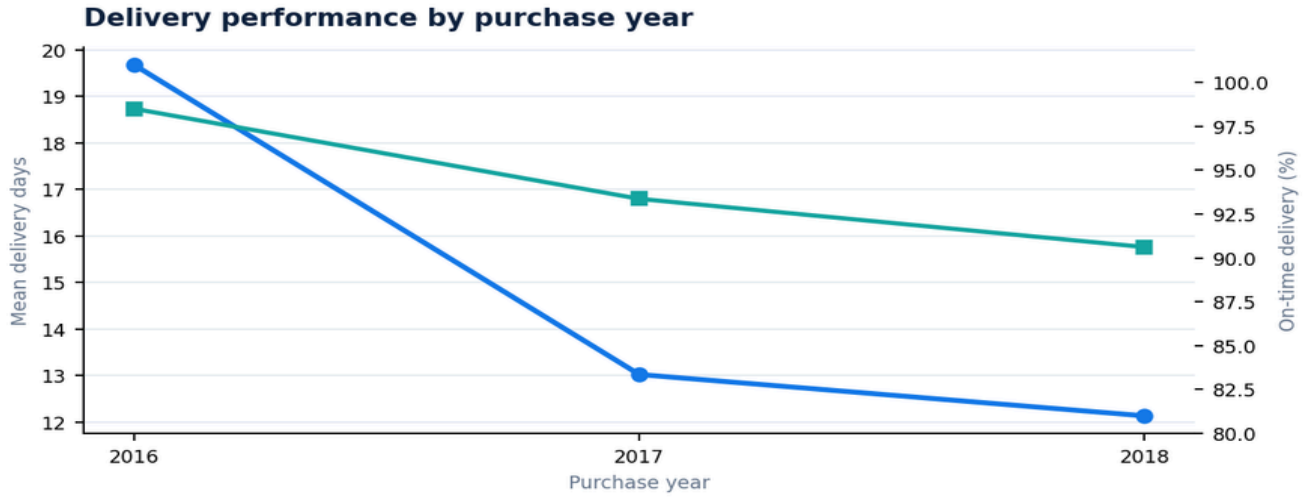

Commercial interpretation

SP deserves close monitoring of availability and delivery capacity because of its large sales contribution. RJ and MG form the next tier. Compare late-delivery rates and review scores by destination before moving logistics resources. Sales concentration can reflect population, platform penetration, assortment or seller availability; it does not prove relative profitability.

Freight and price

Item freight totals R$2,251,909.54; mean freight per item row is R$19.99. Freight variability is likely affected by dimensions, weight, origin/destination and carrier prici.

10. Delivery and operational efficiency

Among delivered orders with usable timestamps, mean purchase-to-delivery time is 12.56 days and median is 10.22 days. 91.88% arrived on or before the estimated date; 8.11% arrived after it. The mean exceeds the median, indicating a longer-delivery tail. These calculations broadly support the dashboard's 12.56-day average and 91.89% on-time figures.

Delivery stage	Mean days	Interpretation
Approval → carrier handover	2.80	Preparation/dispatch interval; validate missing or negative intervals.
Carrier handover → customer	9.33	Largest observed stage; investigate by route, carrier and destination.
Purchase → customer	12.56	End-to-end customer wait.

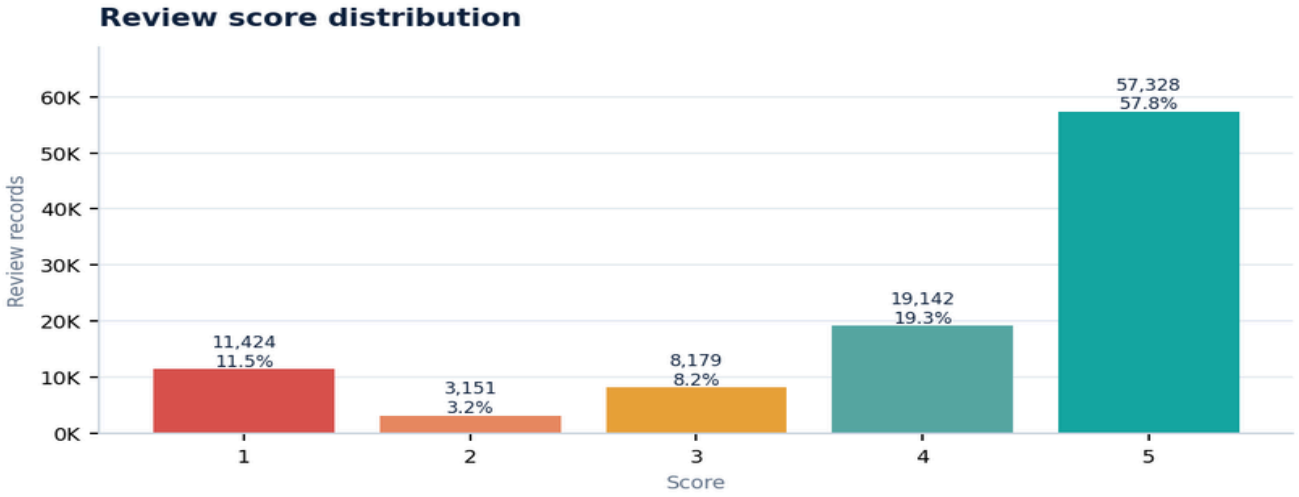

Year comparison requires care

In the extract, mean delivery duration improves from about 13.03 days in 2017 to 12.14 days in 2018, while on-time delivery falls from about 93.4% to 90.6%. These can coexist because promised-date slack, route mix, timing and incomplete cohort coverage affect the binary on-time measure. Do not infer worsening operations from one metric without cohort controls.

Operational priorities

1. Segment late deliveries by destination, seller, category, order month and freight.
2. Track p50/p75/p90/p95, not only mean.
3. Separate approval-to-handover from carrier-to-customer time.
4. Measure how early/late delivery is relative to promise, not only on-time status.
5. Audit impossible timestamp sequences and missing delivery dates.

11. Customer experience and reviews

The dataset contains 99,224 review records. Average score is 4.09/5; 5-star reviews are 57,328 (57.8%) and 1-star reviews are 11,424 (11.5%). Scores 4–5 represent 77.1%; scores 1–2 represent 14.7%.

Interpretation

The distribution is strongly positive overall, but the low-score segment is material. The mean alone hides unhappy experiences. Track low-score rate by seller, category, destination, delivery delay and freight share. Aggregate review charts do not prove the cause of dissatisfaction.

Questions answered

Are customers generally positive? Yes: mean above 4/5 and majority of scores are 4–5.
Is there a negative-feedback segment? Yes: about 14.7% are 1–2 stars.
Do delays cause low ratings? Not established here. Link reviews to order-level delivery and product attributes, compare rates and validate associations.

12. Detailed business questions and answers

1. How large is the dataset?
99,441 orders; 112,650 order-item rows; 32,951 products; 3,095 sellers; 96,096 unique customer identities.

2. What is total product sales?

R$13,591,643.70 in item-price sales, with freight tracked separately at R$2,251,909.54.

3. Is payment value sales?

No. Payment records total R$16,008,872.12, exceeding item-price sales by R$2,417,228.42; reconciliation is required.

4. What is average order value?

R$137.75 mean and R$86.90 median item-price value per order with items; dashboard's R$136.68 requires definition reconciliation.

5. What is the strongest month?

2017-11 at R$1,010,271.37.

6. Which year is strongest?

2018 records R$7,386,050.80 but is incomplete; matched-month comparison is needed.

7. Which payment method dominates?

Credit card is 73.9% of payment records.

8. What share of orders is delivered?

96,478 (97.02%).

9. Canceled/unavailable share?

625 canceled and 609 unavailable; combined 1.24%.

10. How long does delivery take?

Mean 12.56 days; median 10.22 days.

11. Are orders on time?

91.88% on/before estimate; 8.11% after estimate among delivered orders with timestamps.

12. Leading product categories?

health beauty, watches gifts, bed bath table, sports leisure, computers accessories.

13. Which state leads sales?

São Paulo: R$5,202,955.05 or 38.3% of sales by customer state.

14. Are reviews positive?

Mean 4.09/5; 77.1% 4–5 stars, 14.7% 1–2 stars.

15. Is the business profitable?

Cannot determine: product costs, discounts, commissions, refunds, marketing and actual logistics cost are not provided.

16. Why did November 2017 peak?

The data shows the peak but not the cause. Test campaigns, category mix, order count and AOV.

17. What drives low ratings?

Not proven by aggregates. Link review score to delivery, seller, category, freight and destination.

18. Which seller is best?

Cannot decide on sales alone. Compare quality rates, sample sizes and economics.

19. Is the final sales drop real?

Not established; September 2018 coverage appears anomalous and needs validation.

20. What should be done next?

Validate coverage and metric definitions; build an order-level mart; run delivery and review-driver diagnostics.
